Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application using (Original) (Currently Amended) (New) (Canceled) (Previously Presented) nomenclature, as recited in the below listing of claims.

- 1. (Currently Amended) A sensor for sensing the presence of a chemical vapor, the sensor adapted for interconnecting to an electrical monitor for measuring a reaction of the sensor to the chemical vapor, the sensor comprising,
 - a positive terminal, the positive terminal being conductive,
- a negative terminal, the negative terminal being conductive, the terminals adapted for interconnection to the electrical monitor, and
- a film of organic conductive polymer nanofibers extending between the positive and negative terminal for producing a change in conductivity between the positive terminal and the negative terminal as monitored by the electrical monitor when the film is exposed to the chemical vapor, the conductive polymer nanofibers consist of a single polymer.

- 2. (Original) The sensor of claim 1 wherein,
- the positive terminal and the negative terminal are made of gold.

3. (Original) The sensor of claim 1 wherein the positive terminal 1 and the negative terminal are made of gold and the conducting 2 polymer is polyaniline, the sensor further comprising, 3 a thiol surface layer disposed between the terminals and the 4 film. 5 6 4. (Currently Amended) The sensor of claim 1 wherein, 7 the polymer nanofibers are selected from the group consisting of 8 polyaniline nanofibers, polypyrrole nanofibers, polythiophene 9 nanofibers, polytoluidine nanofibers, polyanisidine nanofibers, 10 polymethylaniline nanofibers, polyethylaniline nanofibers, poly(2-11 alkoxyanilines) nanofibers and poly(2,5-dialkoxyanilines) 12 nanofibers. 13 14 5. (Original) The sensor of claim 1 wherein, 15 the polymer nanofibers are polyaniline nanofibers, and 16 the chemical vapor is selected from the group consisting of an 17 acid vapor and a basic vapor. 18 19 6. (Original) The sensor of claim 1 wherein, 20 the polymer nanofibers have diameters less than 500 nm and 21 lengths less than 10 µm. 22 23 7. (Original) The sensor of claim 1 wherein, 24 the polymer nanofibers are polyaniline nanofibers having 25 diameters less than 500 nm and lengths less than 10 µm. 26

8. (Original) The sensor of claim 1 wherein, the polymer nanofibers are polyaniline nanofibers having distributed diameters of 50 nm. 9. (Original) The sensor of claim 1 wherein, the polymer nanofibers are polyaniline nanofibers having distributed diameters of 30 nm. 10. (Original) The sensor of claim 1 wherein, the polymer nanofibers are polyaniline nanofibers having distributed diameters of 120 nm.

11. (New) A sensor for sensing the presence of a chemical vapor, the sensor adapted for interconnecting to an electrical monitor for measuring a reaction of the sensor to the chemical vapor, the sensor comprising, a positive terminal, the positive terminal being conductive, a negative terminal, the negative terminal being conductive, the terminals adapted for interconnection to the electrical monitor, and a film of organic conductive polymer nanofibers extending between the positive and negative terminal for producing a change in conductivity between the positive terminal and the negative 11 terminal as monitored by the electrical monitor when the film is 12 exposed to the chemical vapor, 13 wherein the positive terminal and the negative terminal are made 14 of gold and the conducting polymer is polyaniline, the sensor 15 further comprising, 16 a thiol surface layer disposed between the terminals and the 17 film. 18 19 12. (New) The sensor of claim 1 wherein, 20 the nanofibers have a diameter of less than 500 nm. 21 22 23 24 25 26 27 28 111
